**Ref**: Elcon/ Mauli Krupa Developers/DD/2526-105/**05** **Date**: 07.11.2025

To,
Executive Engineer,
Drainage Department,
KDMC, Kalyan (West).

**Sub: Design of drainage disposal system for proposed Residential cum Commercial Building on plot bearing S. No. 11 H. No.4/A & 4/B At Village- Kolivali, Tal- Kalyan, Dist.-Thane**

Dear Sir,

We are submitting design of drainage disposal system for Residential cum Commercial Building on plot bearing S. No. 11 H. No.4/A & 4/B At Village- Kolivali, Tal- Kalyan, Dist.-Thane. The drainage system has been designed for the BLDG.01 population of 733 person STP capacity proposed is 80 kld KDMC benchmark levels has been followed for the same.

Thanking You,
**For Elcon Engineers**

**1.10** SEWAGE/WASTE DISPOSAL SYSTEM
**1.11** SOLID WASTE MANAGEMENT

ELCON

## 1.1 CODES AND STANDARDS:

1. Following codes, standards and reference are being used for designing the Plumbing System for the ( MAULI KRUPA DEVELOPERS, KALYAN )

a) National Building Code of India, 2016.
b) Handbook on Water Supply and Drainage.
c) Plumbing Engineering Services Designer Code of the British Institute of Plumbing.
d) Uniform Illustrated Plumbing Code - India.
e) Municipal Code of Practice.
f) American Society of Plumbing Engineers.
g) American Society of Mechanical Engineers.

## 1.2 GENERAL NOTES:

1. The project includes ( **BLDG.1-BASEMENT+ (GR./ST. + 23RD FL.)**
2. For water supply system for flats, we propose conventional gravity system.
3. Plumbing shafts shall be provided adjacent to each Toilet and kitchen.
   a. All floors Toilet slabs shall be sunken.

## 1.3 WATER SOURCE & IT'S REQUIRMENT:

Water supply requirements have been estimated as per Residential Bldg. based on the number users as per UDCPR with 5 person per tenant with adhered to the guidelines in the National Building Code of India, 2016 as per Table 1 (Clause 4.1.2)

1. Source of water is from Bore well/ Tanker & as per the water quality further water Treatment will be done to use this water for domestic application.
2. Provision is made for connecting municipal water supply line.
3. Total per day peak water requirements for the project for dry season shall be as bel

| WATER DEMAND STATEMENT FOR (PROJECT DETAILS) | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| Sr. No. | Bldg. Name | Unit | No. of. FLR LVL | No. of Bldg. | No. of Per Son/ Unit | Total Nos. of Person | Average daily water REQD / Person 135 LPCD | U.G. Water Tank | | O.H. Water Tank 0.5 day | |

ELCON

1. Total fresh domestic water demand = 53 cum / day.
2. Total flushing water demand = 27 cum / day.
3. The flushing water & landscape water requirement shall be fulfilled by the treated water produced from the common STP of 80 KLD in the project.
4. Instead of grey water treatment plant / ETP, sewer water treatment plant / STP is proposed, as it can treat the black water from the water closet & Urinals along with the grey water & is better than Grey water plant / ETP.

ELCON

## 1.4 WATER STORAGE :-

1. The Domestic water requirement will be supplied through the bore well / Tanker. The flushing & landscape water requirement will be full filled from the STP treated water.
2. Summary of the water storage tank proposed is as follow:-

| | SUMMARY | U.G. TANK WITH 1.5 DAYS STORAGE IN CUM. | | | | O H TANK WITH 0.5 DAYS STORAGE IN CUM | |
|---|---|---|---|---|---|---|---|
| | U G TANK & O H TANK IN CUM / DAY | DOMESTIC | DIMENSION ( L X B X H) | FLUSHING | DIMENSIN (L X B X H) | DOMESTIC | FLUSHING |
| 1.0 | Fire U. G. Tank considering common for BLDG.-1 with max bldg. Height as per NBC 2016 | BLDG.-1 = 150 (8.5 x 6.00 x 3.0 ) | | | | | |
| 2.0 | Residential BLDG.1 | 83 | 4.80x6.00x3.0 | 44 | 2.50x6.00x3.0 | 41 | 22 |
| 2.1 | Fire tank OHT | --- | | | 25 | | |

## 1.5 WATER DISTRIBUTION

### 1.5.1 Water Distribution System:

1 The incoming main lines from Bore well lines shall be fed into underground fire reserve tank from where it shall be allowed to overflow in domestic storage tank, also connection made for domestic water tanks of other buildings without the UG fire tank on that building. Recycled water from STP shall be used for flushing/landscape purpose which will be pumped to the flushing water tanks of each building.

2 All domestic water tanks will be having set of submersible pumps which shall transfer the water from domestic UGT to domestic OHT of each building. Similarly all flushing water tanks will be having set of submersible pumps which shall transfer the water from flushing UGT to flushing OHT of each building.

3 From the overhead tanks, distribution of domestic water shall be done by adopting the gravity system by providing down take pipes from closed grid loop at terrace to all user points/ fixtures. The pipe size shall be based on fixture unit calculations as per NBC 2016 standard.

4 Water distribution for water supply shall be designed on principle of zoning to ensure minimum residual pressure of 1.2 to 2.1 Bar at all user outlets.

5 In order to get adequate flow for top two floors, separate looping shall be done from taking another outlet from OH tank.

6 Pressure reducing valves shall be provided for the lower floors in order to adequate pressure as per NBC-2016.

7 For Flushing of WCs, a separate water supply system shall be provided, consisting of separate

Overhead tanks on Terrace, and gravity supply through separate down-takes. This separate system for flushing shall ensure that the treated effluent water from the STP is re-used. Emergency connection for normal potable Water supply shall also be made to this system.

8 The distribution network shall be provided with adequate number of control valve/ NRV for ensuring continuous uninterrupted supply of water to individual user's outlet. Ball/Butterfly valves of approved make shall be provided as close to the underground tank on every outlet pipe from the storage tank, except the overflow pipe. Overflow and vent pipes shall terminate with mosquito proof grating.

9 The overflow pipe shall be so placed as to allow the discharge of water being readily seen. A stop valve shall also be provided in the inlet water connection to the tank.

10 All inlets, outlets, washouts, vents, ball cocks, overflows control valves and all such other accessories, piping connections including level indicator shall be provided for underground water storage tanks.

11 The pipe sizing shall be based on fixture unit calculation as per NBC 2016 standard.

12 Color coding for various water supply pipes shall be ensured for clear identification.

**1.5.2** The design of water supply system following Fixture units (FU)

Will be considered as per NBC-2016 Table 2 (Clause 4.7.3.1): -

| | | |
|---|---|---|
| a) Water closet with Flush valve | - | 6 FU (each) |
| b) Wash basin ( domestic) | - | 1 FU (each) |
| c) Urinal with Flush value | - | 3 FU (each) |
| d) Ablution tap | - | 1 FU (each) |
| e) Shower | - | 2 FU (each) |
| f) Kitchen sink (domestic) | - | 2 FU (each) |

**1.5.3** Pipe connections (dia.) to various fixtures will be as NBC-2016 Table 3 (Clause 4.7.3.1) follows.

| | | |
|---|---|---|
| a) Water closet with flush valve | - | 25/32 mm |
| b) Wash basin | - | 15 mm |
| c) Urinal | - | 15/20 mm |
| d) Bib tap | - | 15 mm |
| e) Faucet | - | 15 mm |
| f) Kitchen sink | - | 15 mm/20mm |

## 1.6 SANITARY FIXTURES AND FITTINGS (As approved by Architect)

1. All sanitary wares shall be white vitreous China and of standard quality and make.
2. In Building, European pattern wall hung EWC with flush tank has been considered in all toilets.
3. The low flow bib taps should be considered.
4. Kitchen Sinks shall be of stainless steel with drain board along with CP waste coupling and bottle trap shall be provided. The low flow sink cock should be considered.

## 1.7 SANITARY DRAINAGS ( SOIL AND VENT ):

1. All sanitary fixtures will be connected to floor trap (or) 'P' trap with Effective water seal traps.
2. The installation will be designed as a fully ventilated two-pipe system with separate soil and waste stacks. Soil stacks will be cross-vented to a separate vent/anti-syphon age stack.
3. Waste appliances will be connected to deep-seal floor drains or "P' trap and no separate venting of appliances is proposed.
4. Deep seal traps with access caps will be provided at base of waste stacks.
5. The location of stacks shall be coordinated with other services.

6. The sewerage and drainage system shall be designed keeping in view of natural gradient at site, layout of different facilities in block, level of road and other services in vicinity etc.
7. The branch and Down stack pipe sizes will be designed on the basis of FU calculations based on the number of fixture units as per N.B.C of India 2016 Table no 16 (Clause 4.5.2.4.2.1)
8. Total drainage load to connect to sewer line will be calculated based on the number of fixture units specified in N.B.C, 2016 Table no 20 (Clause 4.5.3.5.1).

## 1.8 RAIN WATER HARVESTING RECHARGE PIT

1. Roof drain pipes will be designed considering peak intensity of rainfall of 100mm/hr.
2. Rain water down take pipes shall be installed in plumbing shafts and / or external to the building.
3. External down pipes shall be suitably located based on architectural provisions.
4. Roof outlets will be vertical with bell mouth and khurra with dome gratings. Area of openings onthe grating shall be 150% of area of down take pipe.
5. Rain water will be collected by down take pipes into the recharge pit. The rain water harvesting-Recharge pits is proposed to increase the ground water which shall increase the bore well water level to supply the water requirement for domestic purpose during & after monsoon.

| **Catchment area as adjacent plot in either direction should be added in this Calculation if it is falling in the said plot.** | | | |

ELCON

## 1.10 SEWAGE WATER TREATMENT PLAN

GENERAL DESCRIPTION BASED ON MBBR TECHNOLOGY

i. **Preliminary Treatment — Screening and Oil & Grease Removal**

Sewage generated is collected in common Drain. Common Drain Pipe is further connected to Inlet Chamber of STP. Sewage is further passed thru 10 mm manual Screen for removal of suspended particles and further it passes through Corrugated Plate Interceptor for Oil and Grease removal. The 'Floating Free Oil' shall be removed manually from oil and grease Chamber. The Screenings and Floating oil shall be removed periodically. Keeping in view the Flow variation at the Process Plant, Equalization Tank is designed at Downstream of Oil and Grease Chamber. Equalized sewage is kept in suspension by using air blower and it is pumped to MBBR Reactor 1&2.

ii. **Secondary Treatment- Moving Bed Bio-Reactor (MBBR) System & Secondary Settling Tanh (SST)**

Sewage Pumped from Equalization Tank flows to MBBR Reactor. The proposed biological process is the MBBR system, which utilizes attached growth grown on biomass carriers or media. Aeration will be achieved by coarse bubble diffusers, installed at the reactor bottom in the required pattern. Unique airlift hydraulics will assure mixing of biomass carriers. A media retention screen will be installed at outlet of each stage in order to maintain the carriers inside the reactor, whereas mixed liquor may flow unobstructed. The media retention screens are continuously cleaned by the mixing flow of water, air bubbles and biomass carriers. The treated wastewater will flow from the biological reactor to a SST for solid-liquid separation. Excess Sludge generated
from SST shall be withdrawn to Sludge holding Sump.

iii. **Tertiary Treatment — Disinfection and Filtration**

The Treated Water from SST flows to Clarified Water Tank, where Hypochlorite is dosed for disinfection purpose. Further treated sewage is pumped to PSF and ACF Filters. It will have sand and carbon as Filter would be provided complete with filter backwash arrangement to ensure reduction of Suspended solids & turbidity at the outlet of the PSF and ACF Filters. When the pressure Drop across the filter increases a certain limit, Filter shall be run under backwash mode each filter at a time. Filter Backwash shall be recycled back at the equalization Tank. Filtered water is to be discharged in Existing Drain.

iv. **Sludge Dewatering System - Centrifuge with Centrifuge Feed Pump.**

Sludge from SST flows to Sludge Collection Tank by Gravity. Sludge is fed to centrifuge by means of Centrifuge Feed Pump.

| **Sewage Characteristics** | **Inlet** | **Outlet** |
|---|---|---|
| **BOD (ppm)** | 250 -300 | 10 |
| **COD (ppm)** | 400-500 | 30 |
| **TSS (ppm)** | 150 | < 5 |
| **Oil and Grease** | <2O | < 10 |
| **Temperature (in degree Celsius)** | 25 — 30 | 25-30 |
| **Online PH Correction system** | 5.5-9 | 6.5-8 |

### 1.10.2 PROCESS DETAILS

**Bar Screen** :

Raw sewage from the source is usually received into the bar screen chamber by gravity. Screen provided will remove all floating and big size matter such as plastic bottles, polythene bags, glasses, stones, etc., which may otherwise choke the pipeline and pumps.

**Oil and Grease Trap (Civil Construction)**

If the sewage generated includes maximum quantity from kitchen and canteen, there is a possibility of higher concentrations of oil and grease in the raw sewage. It needs to be removed before biological treatment as it otherwise may cause problems for biological treatment. Usually, a small civil construction tank with a baffle wall and slotted oil pipe skimmer is provided. The oil and grease removed by gravity floats to the surface, which is removed by the oil skimmer (by client).

**Equalization Tank (Civil Construction)**

Usually, sewage generation is more during morning hours and evening hours. Visually no sewage is generated during night hours. Any biological system needs constant feed for bacteria to work efficiently. Hence, it is important to put an equalization tank to collect the excess flow during peak hours and feed sewage in lean hours. A typical equalization tank has a capacity of 8 - 12 hours of average flow rate. The tank is generally of civil construction by client. Provision of air grid is to be made for thoroughly mixing the sewage to make it of homogenous quality and to keep the suspended matter in suspension and to avoid septic conditions.

**Transfer of Sewage**

IEI's scope starts from transfer of sewage from Equalization Tank to MBBR tank. The distance of Transfer should not exceed beyond 5 meter. The transfer pump can be either submersible or non-submersible type for this application. However IEI has considered centrifugal non-submersible type.

The layout shall be as per IEI standard.

The pump should not run dry and Client to ensure sufficient sewage is available in the Equalization Tank.

**Moving Bed Bio Reactor (MBBR)**

Moving Bed Bio Reactor (MBBR) as the name indicates consists of floating media of various Shapes and sizes. The main objective of adding this media is to make available more surfaces Area for bacteria to grow on, thereby maintaining and retaining maximum possible bacterial Population in a limited volume. The MBBR media material allows biomass concentration of 20 — 40 Kg.s/m.3 material. Thus, FMR consists of combination of biomass in attached as well as suspended form. High concentration of biomass enables reduction of aeration tank and in turn reduction in overall cost. Volume of the media shall vary from 6 to 25 % based on the Concentration of organic matter. Another main feature of the MBBR is its compactness. The MBBR consists of biological system for removal of organic matter (BOD, COD), lamella for clarification and chlorine contact tank for disinfection. As all units are placed inside a single tank, it saves space and also increases operational ease.

In MBBR, raw sewage enters at the top of the tank. Air is introduced at the bottom of the tank

through fine bubble diffusers. Media will be in suspension because of the turbulence created by the air. The bacteria required for the oxidation of the organic matter is attached to the media and some part is suspended in the tank. After oxidation, the bacteria grow in number and need to be separated from the aeration tank liquor. The lamella section inside the MBBR helps in clarification and separation of the bacteria (sludge) and clear overflow flows into chlorine contact tank. Lamella plates helps in increasing the settling area and removing the particles effectively in a smaller plan area. In chlorine contact tank, Sodium hypo Chlorite (Na0C1) is added for disinfecting the clarified sewage. Baffle plates are provided to make better contact. The chlorinated treated sewage then flows out of MBBR either for further treatment or for disposal.

**Treated water collection Tank :**

The treated water collection tank can be of civil construction by client in case required. The treated water can be collected either from the chlorination chamber in Scheme I or from Activated Carbon Filter in Scheme II.

## Sludge :

The sludge from the Clarifier to be removed from the bottom of the Clarifier once in a day by client and transferred to sludge drying bed either by gravity or through pump depending on site condition. Before starting the Desludging, shut off the aeration for 30 minutes and allow the sludge to concentrate at the bottom. After concentration, the bottom sludge valve can be open to drain the required quantity of sludge. An air scour pipe is provided to dislodge any media choking the drain outlet. Open the air scour valve for short time to remove the clog

## 1.11 SOLID WASTE MANAGEMENT :

1. The wet waste & dry waste shall be segregated & stored for treatment & disposal to municipal waste disposal authority.
2. The dry waste shall be collected & disposed to the municipal waste disposal authority
3. The wet waste shall be collected & treated in the organic waste composter to convert the kitchen to organic compost to use it as manure for the landscape.
4. The solid waste generated in the project is calculated as below:

**SOLID WASTE MANAGEMENT - OPERATIONAL PHASE ( BLDG.-1 & 2 )**

| Sr. No. | Description | Occupancy (Residential) | Criteria | | Solid Waste Generation | | Total (Kg / Day) |
|---|---|---|---|---|---|---|---|
| | | | Bio-Degradable | Non - Biodegradable | Bio - Degradable (Kg / Day) | Non - Biodegradable (Kg / Day) | |
| 01 | Residential Unit | 540 | 0.300 | 0.200 | 162 | 108 | 270 |
| '02 | Commercial Unit | 193 | 0.120 | 0.180 | 24 | 17 | 41 |
| | | | | | | | |
| | **Total** | | | | **186** | **125** | **311** |

| Sr. No. | Type of Waste | Quantity (Kg / day) | Management |
|---|---|---|---|
| 01 | Biodegradable Waste | 186 | Biodegradable waste will be processed in OWC, and manure so obtained will be used for landscaping. |
| 02 | Non-biodegradable Waste | 125 | Will be handed over to recyclers. |
| 03 | Garden Waste | - | Will be mixed with biodegradable waste and composted in OWC. |

| Sr. No. | Description | Area (Sq. Mtr.) |
|---|---|---|
| 01 | For Dry Waste Storage | 02 |
| 02 | For Machine | 02 |
| 03 | For Curing | 05 |
| 04 | For Bio-medical Waste | 02 |
| 05 | For E Waste | 02 |
| | **Total Area Required** | **17** |
| | **Total Area Provided** | **20** |

## Enlarged View of Detail 'X' (Crates Position in Curing Racks)

| SR.No. | Building No. | REQUIRED AREA (IN SQM.) | PROVIDED AREA (IN SQM.) |
|---|---|---|---|
| 1 | FOR DRY WASTE STORAGE | 2.00 SQ.M. | 2.00 SQ.M. |
| 2 | FOR OWC MACHINE | 2.00 SQ.M. | 2.00 SQ.M. |
| 3 | FOR CURRING PROCESS (RACKS) | 10.00 SQ.M. | 12.00 SQ.M. |
| 4 | FOR BIO-MEDICAL & HAZARDOUS WASTE | 2.00 SQ.M. | 2.00 SQ.M. |
| 5 | FOR E-WASTE | 2.00 SQ.M. | 2.00 SQ.M. |
| | TOTAL AREA REQUIRED | 18.00 SQ.M. | 20.00 SQ.M. |

SECTION AT A-A

## OWC Plant Location for BLDG.NO. -1

| Building No. | OWC Machine Model | Curing Racks Qty. | | Bio-degradable Waste Qty. | Non Bio-degradable Waste Qty. |
|---|---|---|---|---|---|
| | | Single | Double | | |
| BLDG.NO - 01 | UCM 30 | 02 | 00 | 192 Kgs/Day | 129 Kgs/Day |

**Notes:**

1. Three Phase Power Supply up to 5 kW load is required in the Shed. with Proper Earthing connection.
2. Cross Ventilation is must in the shade, if not possible then Proper Exhaust Duct should be provided.
3. Water Tap provision to be available in the shed.
4. Proper Shed need to be build it proposed in open area.
